Luminact provides professional Engineering, Project Management, and Commercial services to Defence and industry in Australia. We specialise in Integration and Interoperability, and our team has experience delivering complex capability acquisition programs.

Summary

Our engineering team has mechanical, communications and RF, systems engineering, and specialist engineering skills, enabling us to deliver end-to-end solutions, across capability lifecycles. Experience working with Defence above

the line, as well as tier one and two contractors below the line, gives us a clear understanding of contemporary project challenges and risks, as well as opportunities.

Description

The focus of our company is enabling great people to do what they do best: innovate and deliver results. Our diversity of skills, wealth of experience, and a strong emphasis on relationships and people drives a culture of accountability, continuous improvement, and ensures quality outcomes for our clients.

Founded in 2016, Luminact was created by a group of like-minded professionals looking to make an impact in consulting and professional services. Our team brings a wealth of experience in leading multi-national private companies, consulting in above-the-line government agencies, and working with small to medium specialist organisations across Australia and Europe.

This provides a solid foundation from which to offer specialist project management, engineering, business intelligence, and public policy and regulatory advice and services to our clients.

Luminact is all about bringing together the best team of intelligent and critical thinkers, with the right experience to shed light on complicated problems and complex systems. We also think its important to empower our team to take dynamic action and give them the freedom to innovate when finding solutions. Our professional services expertise pages give you a glimpse of our potential to add value to your project or organisation.

Unlike most professional service providers, we develop, build, and test defence technology in house. With a workshop and R&D facility located in the eastern suburbs of Melbourne, we have built concept demonstrator vehicles, setup software integration and testing environments, and challenged ourselves to innovate and prototype. A significant portion of our revenue is re-invested in our people and facilities to build our business and develop a genuine, fully Australian-owned defence industry capability.
